

CUSTOMER FEATURE GUIDE

Hermes

The application operating layer for Kubernetes —
Every Application. One Door.

Discover, organize, secure, and launch every application running across your clusters
through a single intelligent gateway.

by ZyvorAI Labs

What is **Hermes**?

Hermes turns Kubernetes from an infrastructure platform into an application platform. It continuously discovers every dashboard, API, and internal tool running in your cluster, recognizes what each one is, monitors its health, and gives users a permanent front door to launch software — no more kubectl port-forward, bookmark sprawl, or namespace archaeology. Think macOS Launchpad and Spotlight, but for your clusters.

40+

REST & gateway endpoints

11

Nebula UI pages

8

Zeus AI insight APIs

recognized platform tools

What's inside this guide

1 · Continuous Discovery	5 features
2 · Recognition & Catalog	5 features
3 · Universal Gateway	5 features
4 · Nebula Launchpad UI	6 features
5 · Spotlight Search	4 features
6 · Zeus AI Intelligence	5 features
7 · Health & Diagnostics	5 features
8 · Application Graph	4 features
9 · Multi-Cluster & Teams	5 features
10 · Security & Access	6 features
11 · Sharing, Audit & Memory	5 features
12 · Deployment & Operations	5 features
Getting started & support	→

Continuous Discovery

Hermes watches the cluster and builds a living application catalog for you — no manual registration.

Cluster-Wide Service Discovery

Continuously watches Kubernetes Services across every namespace and adds them to the catalog automatically.

Stop maintaining spreadsheets of service URLs — the cluster documents itself.

Ingress & Gateway API Routes

Discovers routing from Ingress objects and Gateway API HTTPRoutes, including ingress host metadata on each app.

See the real public entry point for an app, not just its internal service name.

Service Mesh Route Discovery

Reads Istio VirtualServices and Linkerd annotations to map mesh-based routing into the catalog.

Mesh-routed apps become as discoverable as everything else.

Automatic Catalog Refresh

Correlates EndpointSlice readiness and updates the catalog live as the cluster changes.

The catalog is always current without any human upkeep.

Discovery Queue

Surfaces newly found but unpublished services in a dedicated review queue separate from the live launchpad.

Nothing gets a front door by accident — you decide what goes live.

SECTION 2

Recognition & Catalog

Hermes identifies popular software automatically and enriches every app with human-friendly metadata.

Recognized tool	Example signals
Grafana	service name, labels, port 3000
Prometheus	prom/prometheus image patterns
Argo CD	argocd namespace + service names
Harbor	Harbor service patterns
Zeus OS / v9s	Zeus, ConsoleHub, platform labels
Longhorn, Guacamole, Hubble, Traefik	known platform signatures

Signature Recognition Engine

Matches service names, labels, images, and ports against known signatures to identify popular tools automatically.

Apps show up with the right name, category, and icon — usually with zero configuration.

Annotation Enrichment

Optional hermes.zyvor.dev/* annotations set display name, slug, category, icon, owner, dependencies, port, scheme, and path.

Custom in-house apps get the same polished catalog treatment as off-the-shelf tools.

Environment Inference

Labels each app production, staging, or development from annotations, or infers it from the namespace name.

Instantly tell prod from dev without asking anyone.

Published App Catalog

A unified /apps catalog of published applications with categories, search, sort, filter, and view toggles.

One browsable home for every tool your team actually uses.

Catalog Export

Download the full catalog as JSON via the API or the Cluster page action menu.

Feed your app inventory into other systems or keep an auditable snapshot.

Universal Gateway

Every published workload gets a permanent, predictable front door through one reverse proxy.

Stable Launchpad URLs

Proxies apps at predictable paths like `/launchpad/apps/{slug}` and `/a/{namespace}/{slug}`, with legacy aliases.

Links survive pod reschedules and namespace moves — no bookmark ever breaks.

WebSocket Tunneling

Proxies WebSocket upgrades for live dashboards like Grafana, Argo CD, VS Code Server, Open WebUI, and Jupyter.

Interactive tools work fully through the gateway, not just static pages.

SSE, HTTP/2 & gRPC Pass-Through

Supports Server-Sent Events streaming, HTTP/2, and gRPC content types with native backend connection pools.

Modern streaming and RPC apps proxy correctly and efficiently.

Readiness-Gated Proxying

Blocks the proxy with a clear error when a backend has no ready endpoints.

Users never get silently routed to a dead workload.

Zero Port-Forwarding

Replaces the `kubectl port-forward` workflow with search, click, launch, work.

Developers reach any tool in seconds without touching `kubectl`.

Nebula Launchpad UI

A macOS-inspired glass launchpad that looks like applications, not namespaces and pods.

Command Deck Home

A hero with fleet snapshot, a 3-metric summary, Quick Launch tiles, and Mission Control accordions.

The one screen that answers what's running, what's healthy, and what to open.

Cluster Catalog View

Every service grouped by namespace in collapsible sections with human-readable health hints.

Explore the whole cluster's apps without a single kubectl get.

Spaces Organization

Organizes published apps into category-based spaces for browsing.

Find the monitoring stack or CI tools as a group, not a flat list.

Liquid Glass Design System

A tiered translucent glass interface with shared page frames, skeleton loading, and empty states.

A fast, polished, consistent experience across every page.

Keyboard Navigation & Shortcuts

Arrow-key and Enter navigation in Spotlight plus a global keyboard shortcuts help panel.

Power users move through the whole app without a mouse.

Responsive Mobile Layouts

Compact workspace switcher, stacked toolbars, and scrollable category chips below 768px.

Launch and check apps from a phone, not just a desktop.

Spotlight Search

A Command-K palette that finds apps, pages, and answers the way Spotlight finds anything.

Full-Text Catalog Search

Type a few letters to match apps by name, namespace, or category across the whole cluster.

Type **gra**, get **Grafana** — no memorizing service DNS names.

Rule-Based Intent Search

Parses queries into intent so a namespace or category returns exactly the right apps.

Ask for what you mean and get relevant results, not keyword noise.

Natural-Language Search

An LLM-powered search endpoint answers plain-language queries, with rule-based fallback when no LLM is set.

Ask **unhealthy apps in monitoring in English** and get a real answer.

Spotlight AI Commands

Built-in commands like explain, why, diagnose <app>, suggest publish, ns insight, and ai status.

Run **diagnostics and get fleet answers straight from the search bar**.

Zeus AI Intelligence

Natural-language insight over your application catalog — with or without an external LLM.

Fleet Insight

Summarizes overall cluster application health and highlights the services that need attention.

Understand the state of everything at a glance, in plain language.

Per-App Insight

Generates a diagnosis and remediation narrative for a single application.

Know why an app is unhealthy and what to do about it.

Publish Suggestions

Ranks discovery-queue candidates so you know which services are worth publishing.

Curate the launchpad quickly instead of reviewing everything by hand.

Namespace, Owner & Graph Insight

Health rollups per namespace and per team, plus topology insight for unresolved dependency links.

Slice fleet intelligence by the dimension you care about.

Dual-Mode LLM + Rules

Uses an OpenAI-compatible LLM when configured and falls back to deterministic rules otherwise; a status endpoint reports which is active.

Full intelligence with no external API required — connect an LLM only if you want richer answers.

Zeus AI works out of the box in **rule-based mode** with no API key. Point it at OpenAI, an OpenAI-compatible endpoint, or a local Ollama install (helper script included) to unlock richer natural-language answers.

Health & Diagnostics

Real-time health for every app, translated from raw probe errors into answers humans can act on.

Real-Time Health Status

Classifies every app as Healthy, Degraded, or Offline from endpoint readiness and backend probes.

[Know an app works before you send a teammate to it.](#)

Attention Queue

The Health page lists exactly the services that need action, with an AI summary.

[Focus on what's broken instead of scanning a wall of green.](#)

Diagnose Drawer

A global drawer showing route lens, suggested kubectl commands, probe errors, and Zeus AI insight for any app.

[Go from something's wrong to a fix without leaving the launchpad.](#)

Friendly Probe Summaries

Maps raw errors like context deadline exceeded into short summaries with an expandable technical view.

[Everyone understands the status; operators can still see the raw detail.](#)

Fleet Health Indicators

Home hero and navbar health chip reflect the live fleet health percentage.

[A single glance tells you how the whole cluster is doing.](#)

Application Graph

See how your applications actually connect, and where a dependency is failing.

Dependency Topology

A /graph page rendering nodes and edges of app-to-app dependencies with interactive filters.

[Understand what talks to what before you change or debug something.](#)

Mesh Route Filters

Filter the graph by service-mesh routing to focus on mesh-connected apps.

[Isolate the mesh view when tracing east-west traffic.](#)

AI Focus Chips

Zeus AI highlights unresolved or broken dependency links directly on the graph.

[The graph points you at the weak link instead of leaving you to hunt.](#)

Declared Dependencies

Reads depends-on annotations to draw explicit relationships like Grafana to Prometheus to Loki.

[Your intended architecture shows up as a real, navigable map.](#)

Multi-Cluster & Teams

Merge catalogs across clusters and organize applications by the teams that own them.

Federated Catalog

Merges catalogs from remote Hermes clusters into one view with remote health.

[One launchpad spanning dev, prod, edge, and cloud clusters.](#)

Cross-Cluster Publishing

Publish apps, bulk-publish namespaces, and set recommendations on federated clusters via the API.

[Curate remote clusters without leaving your home Hermes.](#)

Team Ownership Views

The Teams page groups applications by owner metadata with per-team health rollups.

[Instantly see which team owns what — and how their apps are doing.](#)

Workspace Filtering

Filter the catalog by environment workspace (dev / staging / production), with permissions via OIDC groups.

[Each person sees the environment slice that's relevant to them.](#)

Cluster Registry

Lists local and federated clusters and reports remote health and RBAC.

[A single inventory of every cluster Hermes knows about.](#)

Security & Access

Internal stays internal until you say otherwise — with auth, RBAC, and network controls.

Explicit Publish Control

autoPublish defaults to off, so discovered apps require an explicit publish action or published annotation.

No workload is ever exposed by accident.

API Key & OIDC Auth

Optional authentication via static API key or OIDC single sign-on with session cookies.

Gate the whole surface behind your existing identity provider.

Role Rules & Admin Groups

Configurable role rules plus OIDC admin groups and admin users for elevated actions.

Give the right people admin power without sharing a superuser.

Kubernetes SAR RBAC

Optional SubjectAccessReview enforcement so users only see and reach apps they're allowed to.

Reuse your cluster's own RBAC as the source of truth for access.

Namespace Allow-List & NetworkPolicy

Scope discovery to specific namespaces and restrict pod-to-pod traffic with a bundled NetworkPolicy template.

Contain Hermes to exactly the blast radius you intend.

Federation Trust & RBAC Sync

Forwards identity groups across clusters with trust headers so RBAC stays consistent in federation.

Access rules follow the user across every federated cluster.

Sharing, Audit & Memory

Time-limited share links, a full audit trail, and personal launch memory.

Time-Limited Share Links

Create read-only share tokens with a TTL that proxy directly to an app; admins can list and revoke them.

Hand someone temporary access to a dashboard without granting an account.

Activity Audit Log

Records launches, share access, and admin actions, viewable on the Activity page with CSV export.

Always know who opened what, and when.

Federated Audit Aggregation

Aggregates audit events across federated clusters into a single feed.

One compliance view spanning every cluster.

Favorites

Pin the apps you use most for one-click access.

Your daily tools are always a single click away.

Recents & Recommendations

Tracks recently opened apps and surfaces team-recommended picks on Home.

The launchpad learns your workflow and highlights what matters.

Deployment & Operations

Ship Hermes with a Helm chart, monitor it with Prometheus, and run it on a lean stack.

Helm Chart Install

One helm install deploys the Go controller and Rust server, published as an OCI Helm chart.

[Stand up the whole application layer in a single command.](#)

Prometheus Metrics

Exposes a /metrics endpoint with app totals, audit counters, and uptime, plus a /api/v1/stats summary.

[Wire Hermes straight into your existing monitoring.](#)

Lightweight SQLite Catalog

Controller and server share a single SQLite catalog on a PVC — no external database to run.

[Minimal moving parts and dependencies to operate.](#)

Remote Deploy Tooling

Scripts for remote k3s deploy, LLM configuration, Ollama setup, and end-to-end verification.

[Get from git clone to a verified running cluster fast.](#)

Demo Apps & Smoke Tests

Ships demo Grafana and Prometheus plus smoke and E2E verification scripts.

[Prove the install works end to end in minutes.](#)

GETTING STARTED

Your first 30 minutes

A suggested path to value on day one.

- 1 Install with Helm**
helm install hermes ./charts/hermes -n hermes-system --create-namespace --set global.domain=zeus.local, then open the ingress host or NodePort.
- 2 Let discovery run**
With discoverAll on by default, Hermes watches every namespace and populates the discovery queue automatically — no manual registration.
- 3 Publish your apps**
Review the Discovery page and publish the right services (or set hermes.zyvor.dev/published: "true"). Add annotations to enrich names, icons, owners, and dependencies.
- 4 Launch from the launchpad**
Open the Nebula UI, hit Command-K to Spotlight-search, and click to launch any app through the gateway — no port-forward.
- 5 Optional: connect Zeus AI**
Set HERMES_LLM_API_URL and HERMES_LLM_API_KEY (or run the Ollama setup script) for natural-language search and insight. Rule-based mode works with no key.

Support & contact

Hermes is developed by **ZyvorAI Labs**. For onboarding, a proof-of-concept, or a guided demo, contact your account team at info@zyvor.dev.

Good to know: Feature availability reflects Hermes v0.2. Some capabilities are roadmap-only and not yet shipped, including in-cluster mesh policy editing and federated activity export webhooks. Discovery covers Kubernetes Services, Ingress/Gateway API routes, and Istio/Linkerd mesh routes today; discovery of arbitrary custom resources is on the roadmap. The multi-cluster registry is an early single-cluster-first MVP. Hermes ships with a 30-day trial license (HMAC-SHA256 enforced); continued use requires a commercial license from sales@zyvor.dev.

Hermes

Discover, organize, secure, and launch every application running
across your clusters through a single intelligent gateway.
